

Viega presses ahead
with new trends at the ISH 2011.

viega

Viega presses ahead setting new bathroom standards.

**Highest level of comfort,
best design: Viega Multiplex Trio.**

For many people, the bathroom has long held the status of an oasis of well-being. Detailed solutions by Viega set clear priorities in this trend with impressive design and the highest level of comfort: e.g. the new product upgrades of the Multiplex Trio E fitting or the extra-flat inlet, drainage and overflow fittings by Viega (Fig. 1).

**Volume, temperature and time – hot water on demand:
Viega Multiplex Trio E**

Comfort can always be increased. In this way, Viega is continuing the success story of the Multiplex Trio E. At the ISH, the first fitting for fully automated bathtub filling will be expanded by three products, which all combine intuitive operating comfort and linear design:

Multiplex Trio E2: This product variation of the Multiplex Trio E fittings range has two operating elements. One for water inlet and temperature selection and another for switchover to hand shower and inlet volume.

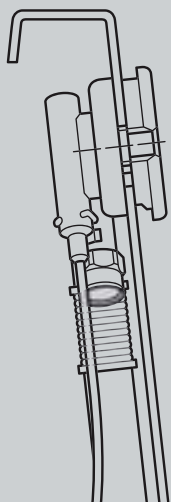

Multiplex Trio E3: One of the two operating elements is equipped with a rotatable display. On one hand, this shows the current water temperature. On the other hand, it shows a user menu when it is pressed lightly. This user menu shows all other functions available to fill the bathtub (Fig. 2).

Multiplex Trio E4: It combines all the operating functions and individually saveable defaults of the fitting into one sophisticated touchscreen panel. The Multiplex Trio E4 even has a shiftable explanatory mode, which quickly familiarises the user with all the technology during initial uses (Fig. 3).

All Multiplex Trio E fittings can be used as standard in the bathtub edge or with an optional expansion set on the wall. And it goes without saying that they can all be combined with all manual and electric inlet, drainage and overflow fittings of the Multiplex and Rotaplex series.

**For extra narrow bathtub rims:
Multiplex Trio Visign MT5**

Back to basics is on trend. For this reason, even bathtub rims are becoming increasingly narrow. Viega is reacting to this phenomenon with extra-flat designer fittings for bathtubs. First and foremost, the new Multiplex Trio Visign MT5 (Fig. 4). With an installation depth of just 33 mm, the inlet, drainage and overflow fitting sets new standards – even in installation, as the new water connection can be fitted with particular ease. The Rotaplex Trio Visign RT5 fitting follows this convincing product idea at the same time. Of course, the pure drainage and overflow fittings of the Multiplex and Rotaplex ranges are also in the reduced installation height: Multiplex Visign M5 and Rotaplex Visign R5.

Viega presses ahead with new product ideas.

The first custom shower channel: Viega Advantix Vario.

Excellent quality, intelligent detailed solutions, unusual design, high-quality materials and a high performance potential are trademarks of the Advantix drainage systems from Viega. The well-designed shower channels, floor drains and corner drains are setting new trends. Viega is proving that design can be even more flexible now with the first continuously reducible shower channel: Viega Advantix Vario!

Viega Advantix Vario: continuous from 30 cm to 120 cm

Individuality is not just a question of design. It is also a question of dimensions. Depending on the spatial situation, the Viega Advantix Vario shower channel offers the desired non-standard length, down to the last millimetre: simply measure the required length and shorten the shower channel with the saw aid supplied and a bench vice (Fig. 1). The locking caps provide secure, precise sealing (Fig. 2). Beyond all standard dimensions, the shower channel can be flexibly integrated into the bathroom architecture – be it short, or long. As a result, it reduces the storage costs for the installer or wholesaler. In addition: simple and reduced design solutions are popular in modern bathrooms. The new Viega Advantix Vario shower channel is also tailored to this trend. Compromises are history.

Installation with or without tile edging

The new Advantix Vario shower channel does not only fit in terms of length; it is also a perfect match for the tile height. The drainage grooves can be designed optionally with or without additional tile edging (Fig. 3). Optically, the new shower channel integrates flawlessly, with purist aesthetics, into the high-quality range of Visign grates. While the channel body made of plastic guarantees longevity, the stainless steel slotted grate (4 mm) with the lateral grooves (8 mm each) emphasises the streamlined design. Matt or high-gloss: you have the choice.

Viega presses ahead with practical solutions.

**This one can hold its own:
Viega Visign for Public.**

Perfect for all public amenities spaces

Visign from Viega is seen in the market as synonymous with exceptional design and unique user comfort. Whether with the minimalist signature of Visign for More or the contemporary look of Visign for Style, actuating panels for WC and urinal flushing have never looked more stylish! Now Viega unveils a new robustness with the customary high standard design: six product versions in the new Visign for Public series look convincing for the public and semi-public sector thanks to the high versatility and unique look (Fig. 1). The WC actuating panels are each fitted with single or dual volume flush technology. The urinal controls are actuated via an infra red sensor.

Robust material, perfect hygiene

Produced entirely in high-grade stainless steel, with a brushed or white lacquered appearance, models in the Viega Visign for Public range are extremely resilient and can withstand all the demands made of public sanitary facilities (Fig. 2). Higher activation frequency meets with unrestricted functionality. The extremely smooth surfaces make cleaning easier and provide optimal hygiene conditions. The actuating panels in the Visign for Public series are naturally compatible with all Viega cisterns.

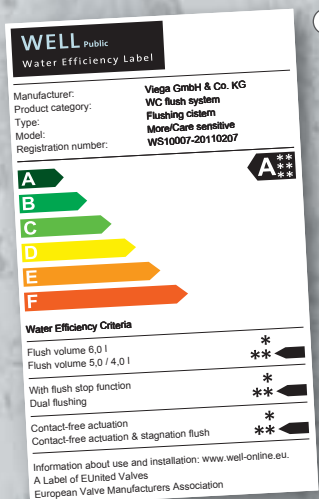

**As stylish as it is strong:
Visign for Style 12**

The actuation panel Visign for Style 12, which is equally popular in the private sector and commercial construction, is now available in a new material design for semi-public areas. A resistant stainless steel body forms the basis of this elegantly designed actuation panel with a brushed matt surface. In addition, the new Visign for Style 12 draws on all the known advantages: easy installation, easy cleaning and sophisticated design (Fig. 3).

WELL: Commitment for our most vital resource.

The Water Efficiency Label – or WELL for short – stands for the product classification system of the European sanitary fittings industry. In accordance with a clearly structured system of points or stars, this scheme offers the consumer a user-friendly guide for the purchase of fittings, flushing systems or accessories. The more stars the label shows, the higher the efficiency class and therefore also water savings. Fittings used in the public and commercial sector are subject to stricter hygiene requirements than privately used systems. Careful use of the most vital resource has always been one of the essential criteria for Viega's product development.

The Viega concealed cistern Visign 2 in connection with the actuating panel Visign for Care (Fig. 2) or Visign for More (Fig. 3) is an excellent example of state-of-the-art water saving technology without limiting drinking water quality. Either as serial or ring piping system these actuating panels ensure automated activation of Stagnations flushes in line when required. That is why they were certified with the highest award of 6 stars in accordance with the rigorous WELL testing criteria (Fig. 4).
