Instruction / Handover of documentation

- Instructions for the operation of the unit and devices were given – the necessary operating documents and available operating and maintenance documents for the abovementioned parts of the unit were handed over. ☐
- It was pointed out that, although every care was taken when planning and installing the unit, water of impeccable quality can only be available at every extraction point when regular water exchange is guaranteed in every part of the installation ☐
- In the case of large units, the temperature at the warm water outlet must always be ≥60 °C
  In the circulation system, the temperature must not fall more than 5 K below this temperature.
  When dealing with small units, attention should be drawn to the risks connected to temperatures < 50°C. ☐
- In accordance with DIN EN 806-5, drinking water heating and drinking water piping systems should be inspected and maintained regularly. It was recommended that the customer enter into a service agreement. ☐
